1 Overview

1.1 The Data Exchange

As part of a new way of working, the Department of Social Services (DSS) has implemented improved program performance reporting processes in grant agreements. DSS has progressively introduced standardised, prioritised, and collaborative reporting processes across many grants programs from 1 July 2014.

This new approach to reporting is streamlined, processes automated and shifts the focus of performance measurement from outputs to more meaningful information about service delivery outcomes.

Data requirements are divided into two parts: a small set of mandatory *priority requirements* that all organisations must report, and a voluntary extended data set that organisations can choose to share with the Department in return for relevant and meaningful reports, known as the *partnership approach*.

Organisations who do not have their own case management tools can access a free, simple IT system (the *Data Exchange* web-based portal). The *Data Exchange* also supports organisations who have compatible case management tools to transfer information directly from their own systems through bulk uploading and system-to-system transfers.

1.2 Purpose of this Document

This document specifies the technical requirements for organisations who would prefer to transmit their data using bulk uploads. This document will focus on the technical requirements for uploading an XML file on to the Data Exchange.

The following is described within this document:

- a) Interface details – technical infrastructure, security and authentication
- b) Reference data
- c) Bulk Upload XML File – data formats, commonly used data terms, examples
- d) Error processing

The *Data Exchange Bulk File Upload Technical Specifications* should be read in conjunction with the *Data Exchange Protocols*, available on the [Data Exchange Website](#).

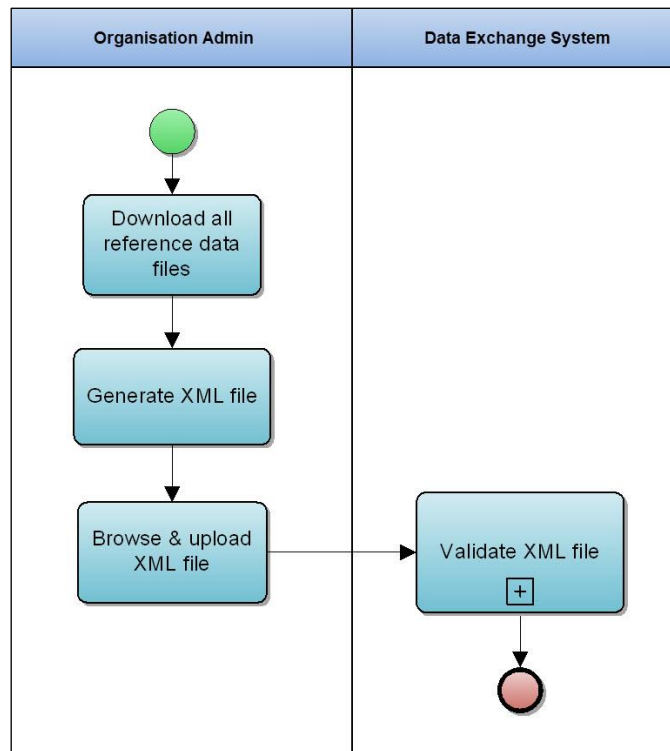

Support for the interface will be provided by email between Monday to Friday, 8:30am to 5:30pm AEST/AEDT, excluding ACT public holidays. For assistance in regards to content in the *Bulk File Upload Technical Specifications*, please contact the helpdesk at DSSDataExchange.Helpdesk@dss.gov.au.

2 Interface Details

Organisations have the option to generate an XML file (containing client, case, session, session assessment and client assessment data) from their in-house application and upload this file in to the Data Exchange Web Portal.

2.1 Getting started

The following diagram illustrates the process for generating a valid XML file to upload:

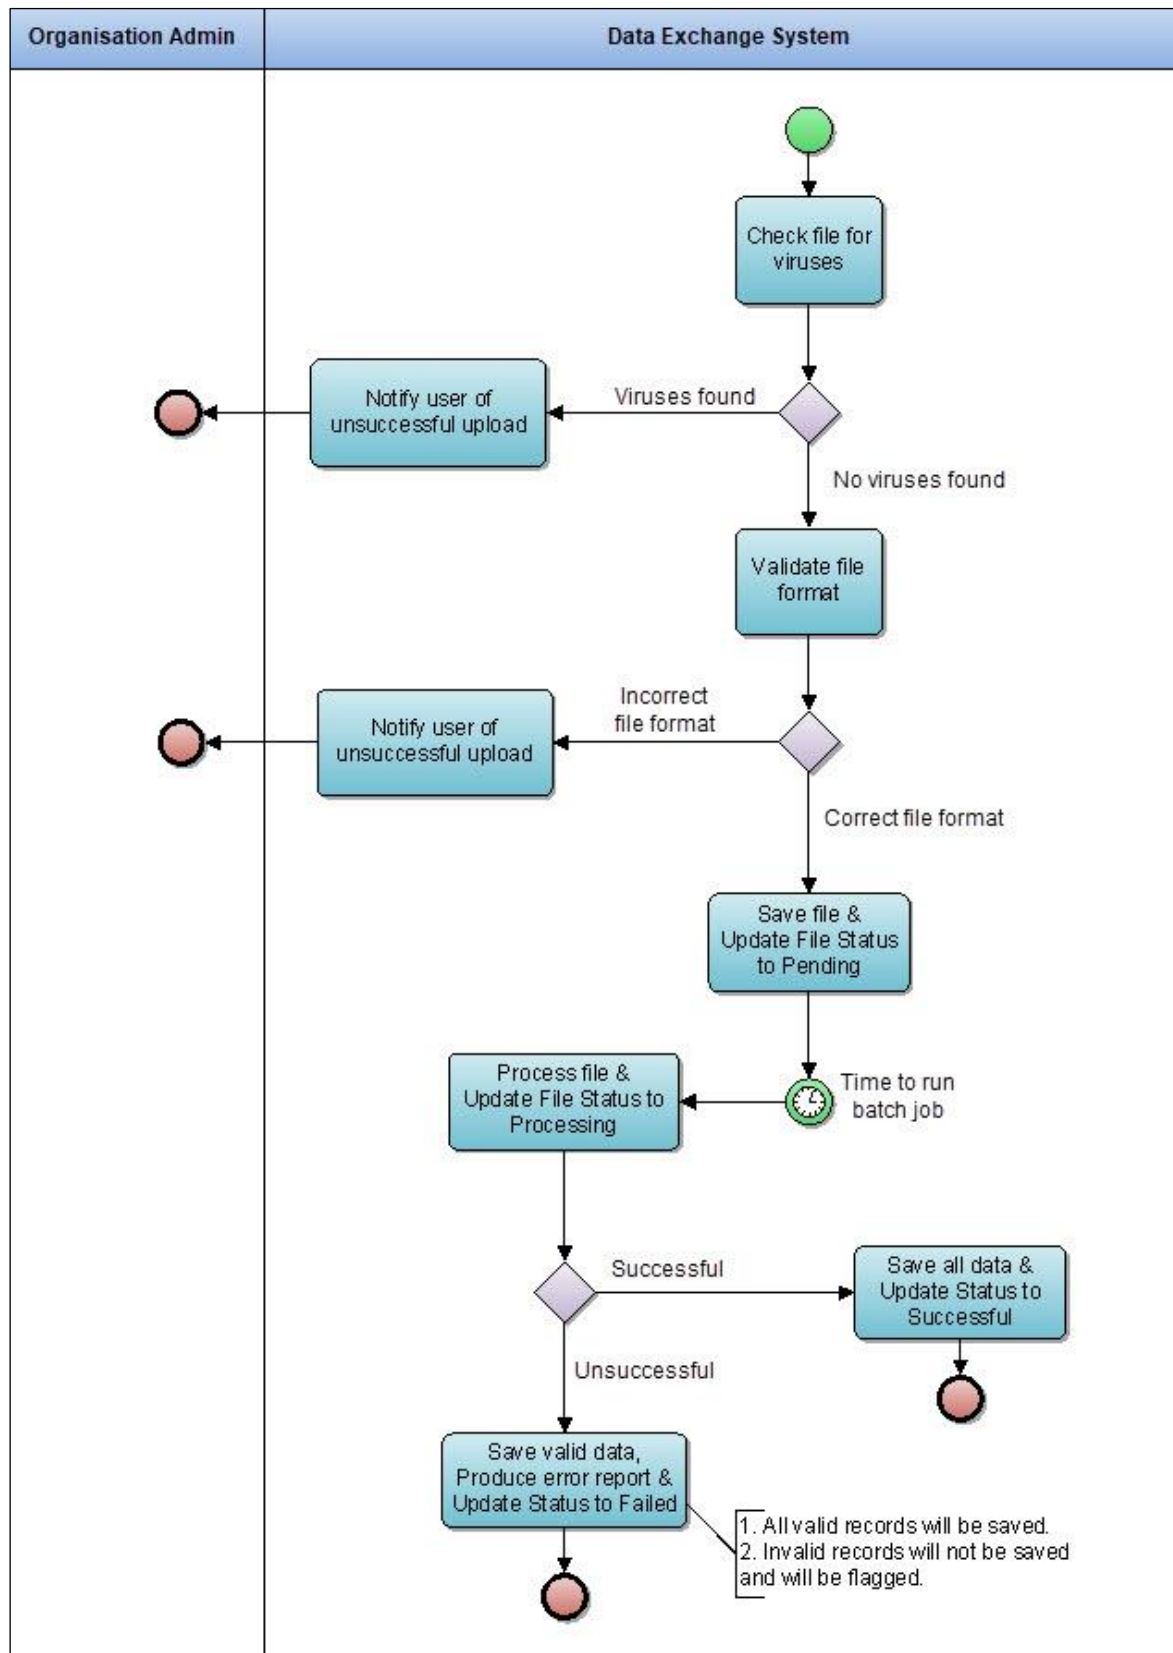

2.2 Business Process Summary

1. Organisations enter client, case, session, client assessment and session assessment details in their in-house systems.
2. Organisations export an xml file with client, case, session, client assessment and session assessment requests from their in-house system. (in a known format – see later for definitions)
3. There are five different types of entities in the Data Exchange. They are Client, Case, Session, Client Assessment and Session Assessment. In the Data Exchange Web Portal, an XML file for each of the entities can be uploaded as a single XML file, or each entity can have their own XML file uploaded, or an XML file with combination of any entity type can be uploaded. The only constraint is that an XML file should at least contain one entity type.
4. Organisations login to the Data Exchange Web Portal and go the “Uploaded files” menu.
5. On View uploaded files page, they click on the button “Upload new file”.
6. Organisations upload the file exported in step (2) into the Data Exchange System.

7. The Data Exchange Web Portal will apply format validation checks to verify that the input xml file is correctly formed and if not, the organisation will get validation errors, and the file will be rejected.
8. If the file passes format validations, the Data Exchange Web Portal will accept the input file and will be queued for processing.
9. Using the Data Exchange Web Portal, organisations can do other tasks while the processing task completes, and can come back when notified that processing has completed.
10. Using Data Exchange Web Portal, organisations can verify that all entities in their uploaded file have been successfully imported (For error processing please refer to error processing section later in this document).
11. If the entity data is not present in Data Exchange system, then new entity will be created, otherwise for an existing entity the information will be updated. E.g., an organisation uploads an xml file for Client with ClientId of CL001. If this ClientId CL001 is an existing record in Data Exchange system for that organisation, then the client details will be updated, otherwise a new client with ClientId of CL001 will be created in Data Exchange system.
12. Within an upload file, each entity type i.e. Case, Session and Client ID must be unique. The file must not contain multiple entity types with the same ID.

2.3 Business Process Diagram

The following diagram illustrates the file validation process when a file is uploaded in to the *Data Exchange System Web portal*:

2.4 File Format

The input file format is XML. The [Bulk Upload XML File](#) section contains format details and examples.

The output error file format is CSV. The [Error Processing](#) section contains format details and examples.

2.5 Security and Authentication

The Security and Authentication function is provided via the Data Exchange Web Portal Web UI Interface uses the Australian Government's digital identity authentication mechanism.

The bulk upload function is available only to Data Exchange Web Portal users who have Organisation Administrator role.

3 Reference Data

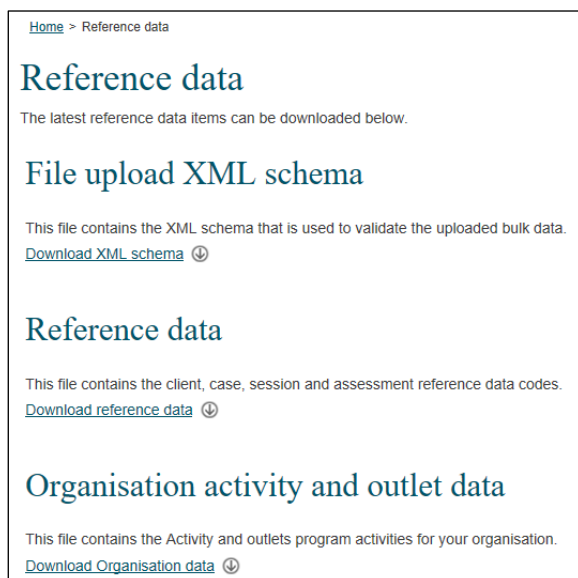

Reference code values are needed to prepare the XML file. Organisations are responsible for downloading these reference data and using it in the XML file that is uploaded to the Data Exchange.

There are two reference data files provided:

1. Reference data.
2. Organisation Activity and Outlet data.

Additional to the reference data files, organisations can also download XML Schema file that can be used to validate the XML file uploaded.

All the above files can be downloaded by accessing the “Reference data” page via the Home page in the Data Exchange Web Portal.

3.1 XML schema file

The uploaded XML file is validated against the rules defined in the XML schema file. If the XML file contains invalid reference codes, the XML file is rejected and the process of file upload fails.

Organisations are recommended to validate their XML files against the provided XML Schema file before uploading bulk data.

3.2 Reference data

Reference data file is a XML file that contains the reference data codes used by the Data Exchange. Organisations are responsible for downloading these reference data and using it in the XML file that is uploaded to the Data Exchange.

3.2.1 Reference data file format

Reference data file contains the code data for the following reference data items:

1. AboriginalOrTorresStraitIslanderOrigin

4 Bulk Upload XML File

4.1 XML Data Types

Definitions of the data types used in input file can be found at the World Wide Web Consortium website. The URL for the specifications for the data types is.
<http://www.w3.org/TR/xmlschema-2/#built-in-datatypes>

4.2 XML Validation Rules

The Message Definition tables in the following sections contain a column with Validation Rules. These rules along with the other business rules are applied to the data as it is processed.

All rules that apply in the online system apply to bulk uploads.

4.3 XML Input File Details

The XML file can contain any number and combination of clients, cases, sessions, client assessments and session assessments. The maximum file size allowed is **10MB**.

The XML file is validated against the XML schema file at the time of upload. If XML structure is found valid, it is queued for processing.

4.3.1 XML Input File Processing

The file is processed in the following order:

1. Clients
2. Cases
3. Sessions
4. Session Assessments
5. Client Assessments
6. Outlets

The business rules applied in the online system are also applied during the bulk upload process.

5 Error Processing

Organisations will have the facility to download an error file for their submissions. Organisations are able to view the errors in the error file, fix the errors in their source system, and upload another file with contains the fixed records for processing.

5.1 Uploaded file errors

5.1.1 View Uploaded Files

Organisations can go to page “View uploaded files” in the Data Exchange Web Portal. This page displays the list of all the files uploaded by the organisation. Organisations can expand the row of the grid where the Status is “Failed”, and can download an error file for their submissions.

Example of View uploaded files with one row expanded to download error file:

File	Uploaded on	Uploaded by	Status
Defect 4509.xml	29/01/2019 2:02:38 PM	BLDEV_IJ005286@blue.local	Successful

Children Rows (repeated): **One row per entity error**

5.2.3.1 Elements within each Entity Node

Element	Data Type	Description
Entity Type	string	Entity type will give details about, as to which entity Data Exchange System was creating, which gave an error. The entity type can be Client, Case, Session, SessionAssessment and ClientAssessment
Parent Entity Details	string	This field will give information about the parent entity for which the child was created. E.g. if session entity is created, then this will give information about, against which case, the session was created. As case is the parent entity of session.
Entity Id	string	Organisation's Id
Error Description	string	This field will give details about the error message
Error Type	string	This field indicates whether the error message is an "error", which means that the record failed to create; or a "warning", which means that the record has created but there is a comment for information
