1 Overview

1.1 The Data Exchange

The Data Exchange represents the program performance reporting approach for client facing funding agreements. The Department of Social Services (DSS) progressively introduced standardised, prioritised, and collaborative reporting processes across grants programs from 1 July 2014.

This approach to reporting is a streamlined, processes automated, and shifts the focus of performance measurement from outputs to more meaningful information about service delivery outcomes.

The requirements of the Data Exchange are divided into two parts: a small set of mandatory priority requirements that all organisations report, and an extended data set, known as the partnership approach. As part of the partnership approach, organisations are encouraged to collect the Standard Client/Community Outcome Reporting (SCORE) information for as many clients as practical.

Organisation can access a free IT system to manually input client data. This helps record clients, service and outcomes data that meet funding agreement performance data requirements and allows organisations to confidentially manage their core client and case information.

1.2 Purpose of this Document

This document specifies the technical requirements for organisations who would prefer to transmit their data using bulk uploads. This document will focus on the technical requirements for uploading an XML file on to the Data Exchange.

This document describes the following:

- Interface details – technical infrastructure, security and authentication
- Reference data
- Bulk Upload XML File – data formats, commonly used data terms, examples
- Error processing

You should read this document in conjunction with the *Data Exchange Protocols*, available on the [Data Exchange Website](#).

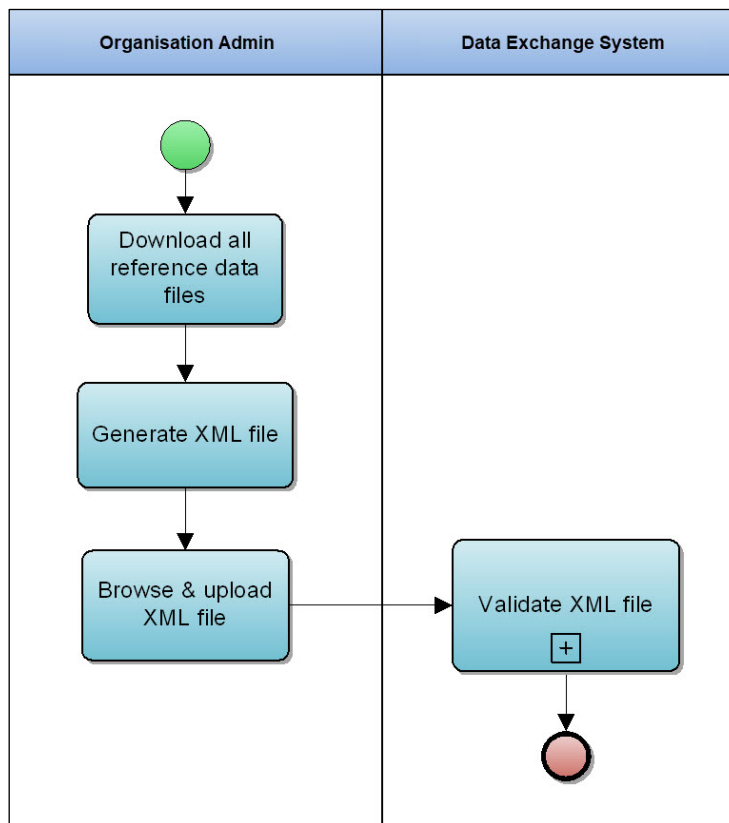

For assistance regarding content in this document, please contact the helpdesk by email at DSSDataExchange.Helpdesk@dss.gov.au or on 1800 020 283.

2 Interface Details

Organisations have the option to generate an XML file (containing client, outlet, case, session, session assessment and client assessment data) from their in-house application and upload this file in to the Data Exchange Web Portal.

2.1 Getting started

The following diagram illustrates the process for generating a valid XML file to upload:

2.2 Business Process Summary

1. Organisations enter client, outlet, case, session, client assessment and session assessment details in their in-house systems.
2. Organisations export an xml file with client, outlet, case, session, client assessment and session assessment requests from their in-house system. (in a known format – see later for definitions)
3. There are six different types of entities in the Data Exchange. They are:
 - Client
 - Outlet
 - Case
 - Session
 - Client Assessment, and
 - Session Assessment

There are 3 different ways you can incorporate entities into an XML upload file:

- You can upload an XML file for each of the entities as a single XML file, or
- Each entity can have their own XML file uploaded, or
- You can upload an XML file with combination of any entitytype. The only constraint is that an XML file should at least contain one entity type.

NOTE: Outlets and Outlet Activities need to be approved, and be within the specified Outlet Activities date range, before a case is associated with it.

4. Organisations login to the Data Exchange Web Portal and go to the **Uploaded Files** menu.
5. On **View uploaded files** page, they click on the button **Upload new file**.
6. Organisations upload the file exported in step (2) into the Data Exchange System.
7. The Data Exchange Web Portal will apply format validation checks to verify that the input xml file is correctly formed and if not, the organisation will get validation errors, and the file will be rejected.
8. If the file passes format validations, the Data Exchange Web Portal will accept the input file and will be queued for processing.
9. Using the Data Exchange Web Portal, organisations can do other tasks while the processing task completes, and can come back when notified that processing has completed.
10. Using the Data Exchange Web Portal, organisations can verify that all entities in their uploaded file have been successfully imported (For error processing please refer to error processing section later in this document).
11. If the entity data is not present in the Data Exchange system, then a new entity will be created. Otherwise, for an existing entity the information will be updated.

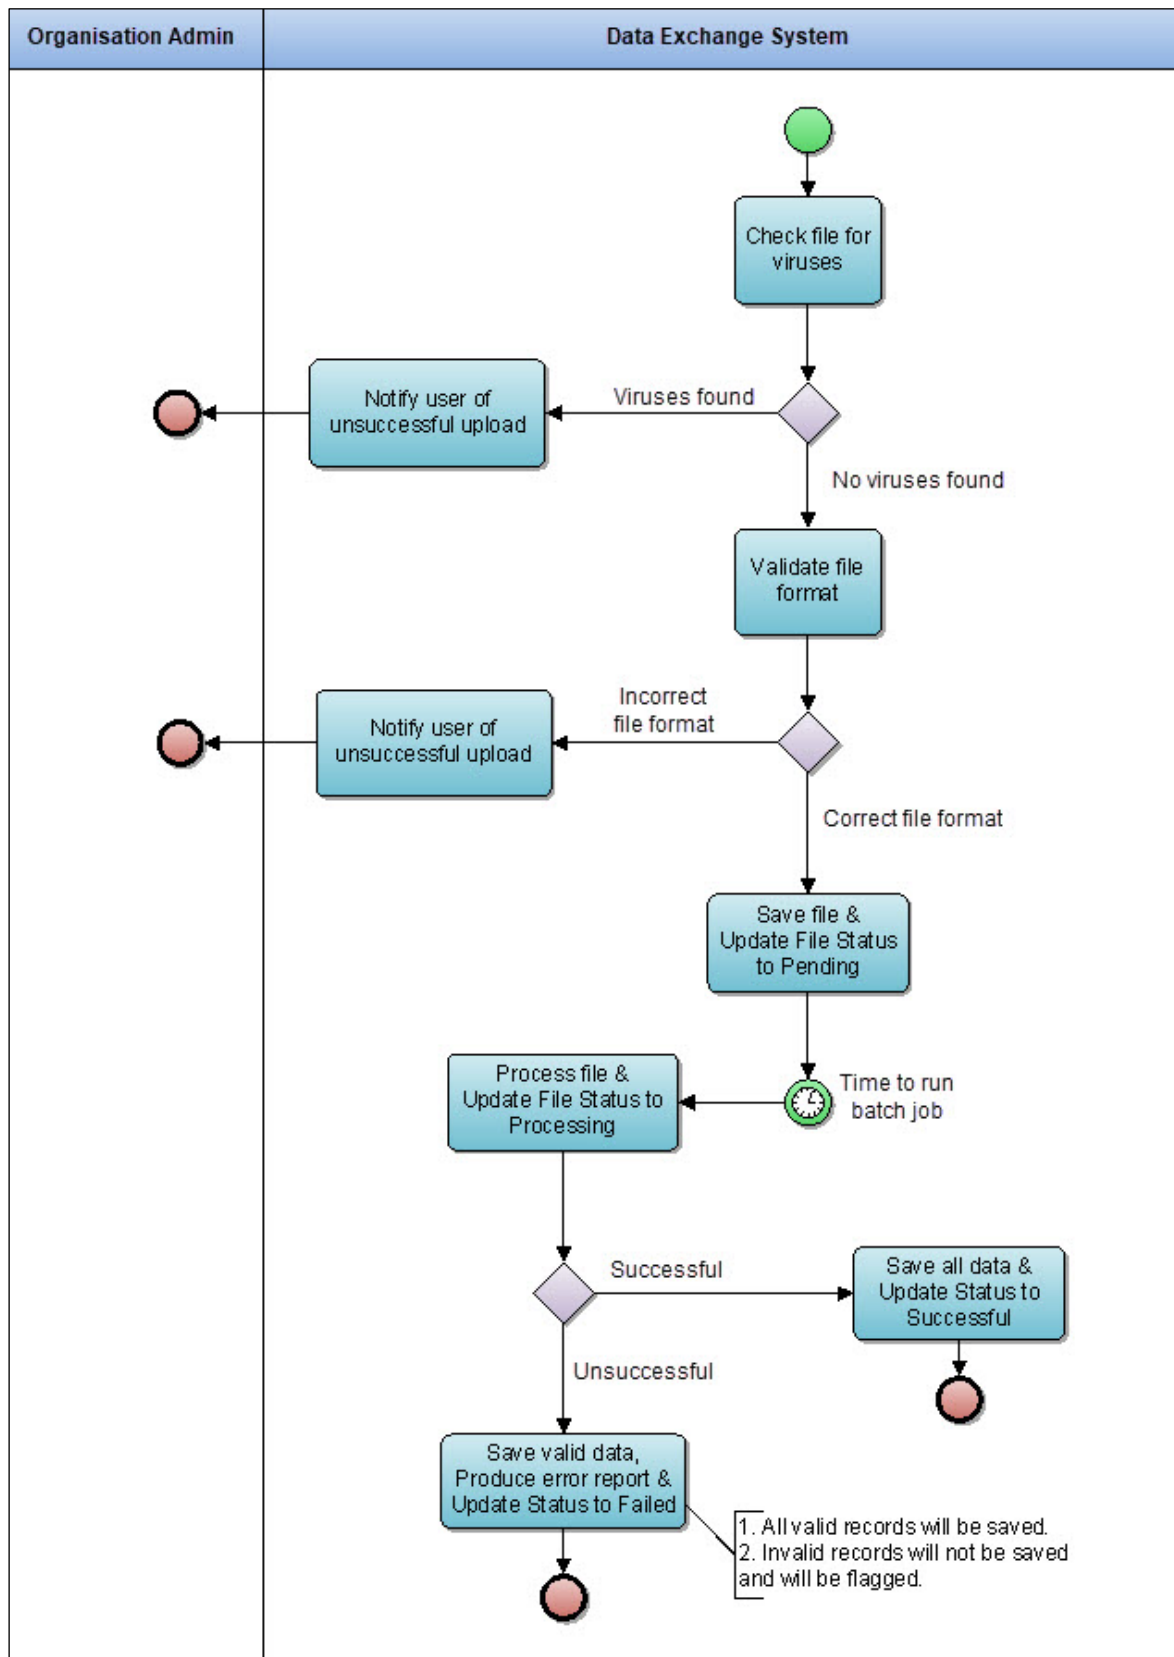

Example: an organisation uploads an xml file for Client with ClientId of CL001. If this ClientId CL001 is an existing record in Data Exchange system for that organisation, then the client details will be updated, otherwise a new client with ClientId of CL001 will be created in Data Exchange system.

12. Within an upload file, each entity type i.e. Case, Session and Client ID must be unique. The file must not contain multiple entity types with the same ID.

IMPORTANT: IDs are **not** case sensitive.

2.3 Business Process Diagram

The following diagram illustrates the file validation process when a file is uploaded in to the *Data Exchange System Web portal*:

2.4 File Format

The input file format is XML. The [Bulk Upload XML File](#) section contains format details and examples. The output error file format is CSV. The [Error Processing](#) section contains format details and examples.

2.5 Security and Authentication

The Security and Authentication function provided via the Data Exchange Web Portal Web UI Interface uses the Australian Government's Digital Identity authentication mechanism.

The bulk upload function is available only to Data Exchange Web Portal users who have Organisation Administrator role.

2.6 Statistical Linkage Key (SLK)

Selected letters of Family name, Given name, Date of birth and Gender are used to generate a statistical linkage key to facilitate the linkage of records for statistical purposes only. The SLK ensures that individual clients will not be identified from data in the collection, and comprises the alpha code derived from a client's name, their gender, and full date of birth.

2.6.1 SLK Algorithm

The following algorithm is used to generate an SLK for use with the Data Exchange system.

- Record 2nd, 3rd and 5th letters of last name (family name).
- Record 2nd and 3rd letters of first (given) name.
- Record the date of birth as a character string of the form ddmmyyyy.
- Record the gender of the client as :
 - Code 1 for Male
 - Code 2 for Female
 - Code 3 for Intersex or indeterminate
 - Code 9 for Not stated/inadequately described
- Do not count hyphens, apostrophes, blank spaces, or any other character that may appear in a name that is not a letter of the alphabet.
- Where the name is not long enough to supply all the requested letters, fill the remaining squares with a 2 to indicate that a letter does not exist. This will occur if the first name is less than 3 characters and if the last name is less than 5 characters. If a name is too short, complete with 2's.
- Where a name or part of a name is missing, substitute a 9 to indicate that the letter is not known.
- Always use block capital letters for SLK.

2.6.2 SLK Regular Expression

- The following regular expression may be useful for validation of your generated SLK.
Please note: The regular expression allows 29 days in any February, it does not check for leap years.
- `([9]{3}[A-Z]([2]{2}[A-Z][A-Z,2]))([9]{2}[A-Z][A-Z,2])((((0[1-9]][1-2][0-9]))(3[01]))(0[13578])(1[02]))((((0[1-9]][1-2][0-9]))(30))(0[469])(11))((0[1-9]][1-2][0-9])02)(19|2[0-9])[0-9]{2}[1 2 3 9]`

3 Reference Data

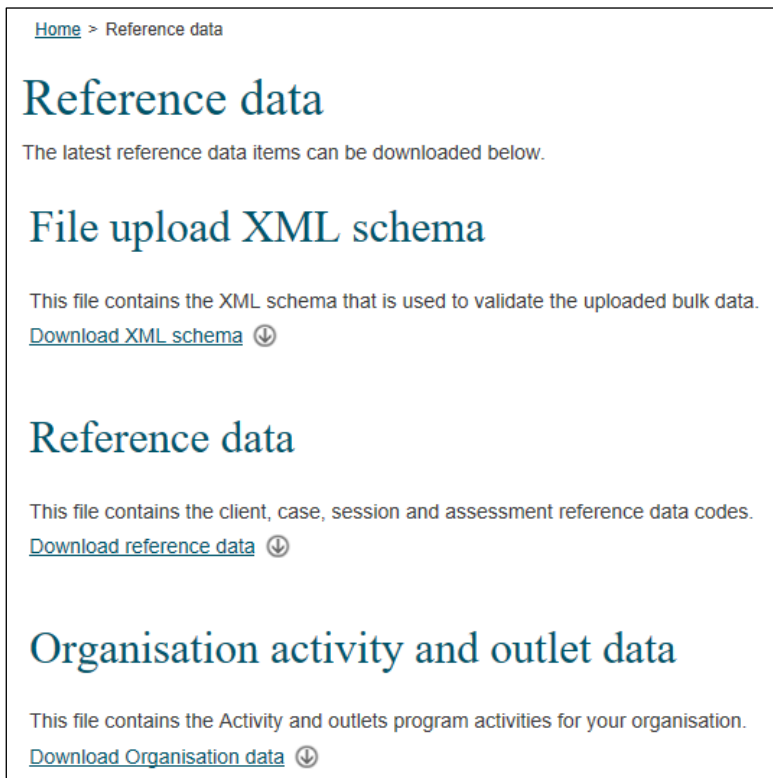

Reference code values are needed to prepare the XML file. Organisations are responsible for downloading these reference data and using them in the XML file that is uploaded to the Data Exchange.

There are two reference data files provided:

1. Reference data.
2. Organisation Activity and Outlet data.

Additional to the reference data files, organisations can also download an XML Schema file that can be used to validate the XML file uploaded.

All the above files can be downloaded by accessing the **Reference data** page via the Home page in the Data Exchange Web Portal.

Home > Reference data

Reference data

The latest reference data items can be downloaded below.

File upload XML schema

This file contains the XML schema that is used to validate the uploaded bulk data.

3.1 XML schema file

The uploaded XML file is validated against the rules defined in the XML schema file. If the XML file contains invalid reference codes, the XML file is rejected and the process of file upload fails.

Organisations are recommended to validate their XML files against the provided XML Schema file before uploading bulk data.

4 Bulk Upload XML File

4.1 XML Data Types

Definitions of the data types used in the input file can be found at the World Wide Web Consortium website. The URL for the specifications for the data types is:

<http://www.w3.org/TR/xmlschema-2/#built-in-datatypes>

4.2 XML Validation Rules

The Message Definition tables in the following sections contain a column with Validation Rules. These rules along with the other business rules are applied to the data as it is processed.

All rules that apply in the online system apply to bulk uploads.

4.3 XML Input File Details

The XML file can contain any number and combination of clients, cases, sessions, client assessments and session assessments. The maximum file size allowed is **10MB**.

The XML file is validated against the XML schema file at the time of upload. If XML structure is found valid, it is queued for processing.

4.3.1 XML Input File Processing

The file is processed in the following order:

1. Clients
2. Cases
3. Sessions
4. Session Assessments
5. Client Assessments
6. Outlets

The business rules applied in the online system are also applied during the bulk upload process.

4.4 XML Input File Definition

XML Root:	DEXFileUpload
XML Child Nodes:	Clients Cases Sessions SessionAssessments ClientAssessments Outlets

4.4.1 Clients

Clients node consists one or more *Client* nodes. Each *Client* node represents a client that needs to be added or updated.

4.4.1.1 Client Node

Elements within *Client* node:

5 Error Processing

Organisations will be able to download an error file for their submissions. Organisations are able to view the errors in the error file, fix the errors in their source system, and upload another file which contains the fixed records for processing.

5.1 Uploaded file errors

5.1.1 View Uploaded Files

Organisations can go to the 'View uploaded files' page in the Data Exchange Web Portal. This page displays the list of all the files the organisation uploaded. Organisations can expand the row of the grid where the Status is 'Failed', and can download an error file for their submissions.

Example of 'View uploaded files' page, with one row expanded to download error file:

File	Uploaded on	Uploaded by	Status
Defect 4509.xml	29/01/2019 2:02:38 PM	BLDEV_IJ005286@blue.local	Successful
ALL (basic).xml	18/01/2019 10:34:43 AM	BLDEV_IJ005286@blue.local	Successful
ALL (basic).xml	18/01/2019 10:20:59 AM	BLDEV_IJ005286@blue.local	Failed
Comments: Error report: ALL (basic).xml.csv			
OUTLET -sys.xml	18/01/2019 10:11:28 AM	BLDEV_IJ005286@blue.local	Successful
OUTLET -sys.xml	18/01/2019 10:10:13 AM	BLDEV_IJ005286@blue.local	Successful

5.1.2 Upload file details

Organisation can click on any of the files and see more information about that file, such as upload progress, and breakdown of total, successful and failed records by entity type.

Example of Upload file details:

File name:	ALL (basic).xml
Status:	Failed
Current progress:	<div style="width: 100%; background-color: green; height: 10px;"></div> 100%

5.2 Error Report File

5.2.1 Format

The error file format is **CSV**. Users will be able to open the error file directly into their preferred tool (i.e. MS Excel, Office, etc.) in their desktop, allowing them to identify and fix errors.

5.2.2 Error Report File Details

The output file will show entities that were imported in error, and were not accepted as valid by the system.

5.2.3 Error Report File Definition

Header Row: **Field Names**

Children Rows (repeated): **One row per entity error**

5.2.3.1 Elements within each Entity Node

Element	Data Type	Description
Entity Type	string	Entity type will give details about, as to which entity Data Exchange System was creating, which gave an error. The entity type can be Client, Outlet, Case, Session, SessionAssessment and ClientAssessment.
Parent Entity Details	string	This field will give information about the parent entity for which the child was created. E.g. if session entity is created, then this will give information about, against which case, the session was created. As case is the parent entity of session.
Entity Id	string	Organisation's Id.
Error Description	string	This field will give details about the error message.
Error Type	string	This field indicates whether the error message is an "error", which means that the record failed to create; or a "warning", which means that the record has created but there is a comment for information.

5.2.3.2 Output File Example (An error with each entity type)
